1. PREMESSA

La presente relazione ha per oggetto le calcolazioni statiche della struttura adibita all'insediamento di nuove aule scolastiche all`interno del fabbricato, in precedenza destinato a centrale termica, situato in prossimità delle nuove segreterie e di fronte al laboratorio prove del Dipartimento di Ingegneria Strutturale, Edile e Geotecnica (DISEG) del Politecnico di Torino, nella sede centrale di c.so Duca degli Abruzzi 24 a Torino.

Il fabbricato originario, risalente all'inizio degli anni '50, presenta una struttura in c.a. su tre livelli:

- piano interrato;
- piano terreno;
- piano di copertura.

Delle strutture originarie e delle successive integrazioni, sono stati trasmessi tutti i documenti in possesso della stazione appaltante che, malgrado siano incompleti, hanno comunque consentito di sviluppare la maggior parte delle considerazioni progettuali in maniera logica ed esecutiva.

Il piano terra esistente è realizzato mediante una soletta a piastra nervata in c.a. (spessore 15 cm) irrigidita mediante travi ribassate calcolate per portare un carico utile di 20.00 kN/mq, come dichiarato dai progettisti negli elaborati progettuali originari. Tale soletta ha sostenuto fino ad oggi, imponenti macchinari termici, grazie ad un consolidamento strutturale avvenuto in una fase successiva alla realizzazione del fabbricato.

La capacità portante della soletta è ampliamente sufficiente a sostenere i nuovi carichi previsti dal cambio di destinazione d'uso che consistono in 2.00 kN/mq di carico permanente portato e un carico d'esercizio di 4.00 kN/mq.

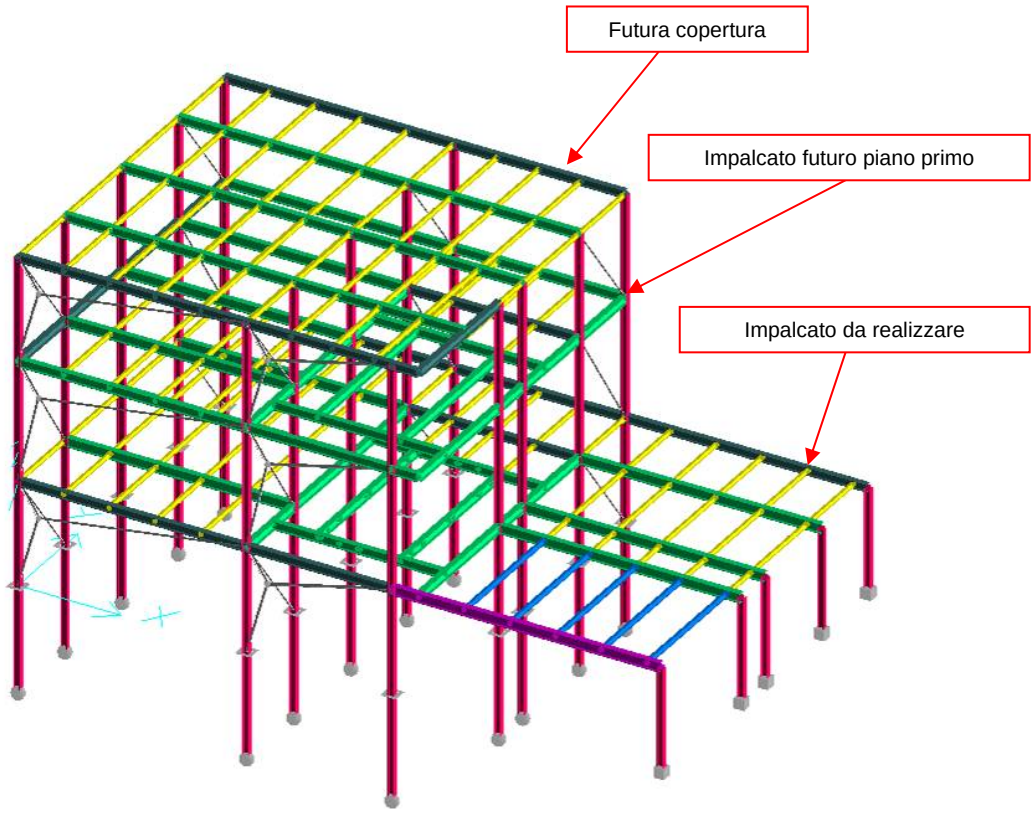
Dal piano terra proseguono verso l'alto i soli pilastri perimetrali anch'essi in c.a., fondati al di sopra del muro controterra e collegati fra loro da un cordolo; la funzione dei pilastri è quella di sostenere la copertura.

La copertura è realizzata mediante un solaio piano in laterocemento (di spessore 20 + 5 cm) ordito nella direzione trasversale e sostenuto mediante l'impiego di travi a T ribassate in c.a.; è stato verificato mediante calcolazione numerica che la capacità portante del solaio di copertura è idonea a sostenere un carico utile pari a 2.50 kN/mq in aggiunta al peso proprio.

La struttura oggetto del presente progetto è stata concepita staticamente indipendente dall'edificio esistente. L'ossatura portante viene eseguita mediante pilastri metallici atti a sopperire il carico trasmesso da un impalcato intermedio realizzato in carpenteria metallica resa collaborante ad un getto in calcestruzzo armato. Tale solaio di interpiano verrà realizzato ad una quota intermedia tra il piano terra esistente e l'intradosso della copertura nervata.

Il progetto prevede di realizzare a piano terra due aule ciascuna delle quali con uscite di sicurezza principali, prospicienti sul lato del dipartimento strutture; dal piano terra è collegato al

piano primo e quindi alle corrispettive aule, attraverso due scale metalliche incrociate oppure attraverso l`ascensore esterno. Anche a questo livello sono presenti uscite di sicurezza indipendenti e localizzate sul retro e sul fianco del fabbricato. Nell'interrato sono mantenute alcune delle attrezzature impiantistiche mentre altre vengono rinnovate e sostituite.



Modello della nuova struttura metallica comprensiva di ampliamento

L`esigenza della stazione appaltante è stata inoltre quella di prevedere la possibilità futura di ampliamento, implementando il numero di aule da quattro a cinque, allocando sulla copertura del fabbricato il nuovo spazio dedicato all'insegnamento. Pertanto quanto qui presentato, è già stato previsto per sopperire ai carichi derivanti da un'ulteriore aula con relativa struttura di copertura, posizionata a livello della copertura odierna ma da essa indipendente.

In copertura sono inoltre posizionate macchine UTA localizzate in una posizione che non interferisce con l'eventuale futuro ampliamento.

La nuova struttura si fonda su plinti in c.a., che in alcuni punti interferiscono con la fondazione esistente dei pilastri o con la ciabatta del muro controterra. Nei punti d'interferenza i plinti vengono solidarizzati mediante la resinatura delle barre in acciaio all'interno dei vecchi plinti in modo da far collaborare la fondazione esistente con quella di nuova esecuzione.

I pilastri in acciaio sono solidarizzati all'estradosso del plinto mediante una piastra nervata in acciaio ed ancorati allo stesso mediante tirafondi con ancoraggio ad uncino nel caso in cui siano solidarizzati in un getto di nuova esecuzione oppure con barre d'acciaio ad aderenza migliorata resinate al'interno dei plinti esistenti.

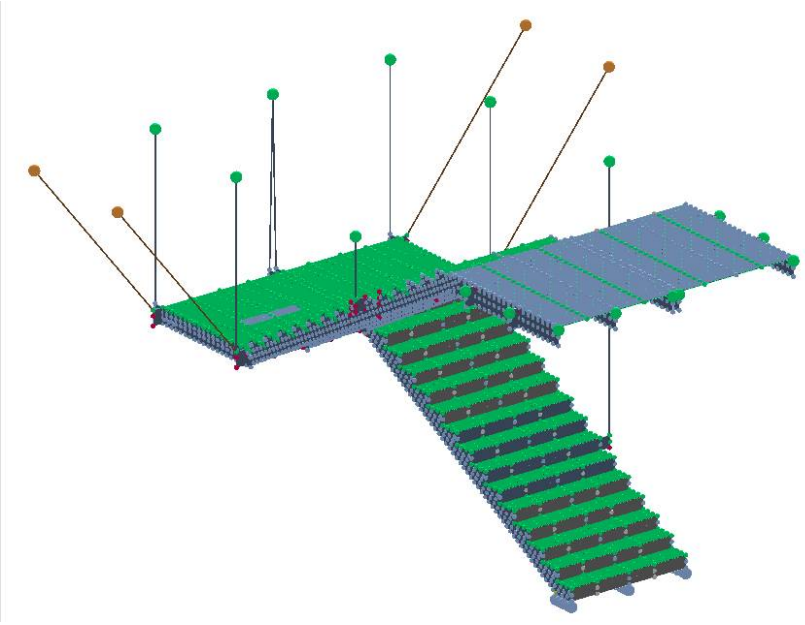
I pilastri della fila esterna (PA 4 – 8 – 14 - 20) si appoggiano tramite una piastra d'acciaio nervata sulla trave di bordo esistente, coadiuvata da pilastrini in c.a. appositamente realizzati in modo da solidarizzare l'estradosso dei muri controterra con l'intradosso della soletta di piano terra esistente.

Le posizioni dei pilastri sono state individuate in modo da non interferire con le travature del piano terra esistente e soprattutto con gli impianti localizzati nell'interrato. Si prevede quindi di sfruttare il solaio del piano terra come vincolo trasversale per le nuove pilastrate metalliche in modo da trasmettere le sollecitazioni di natura trasversale sul muro di contenimento perimetrale che garantisce il comportamento scatolare del comparto fondazionale. A garanzia di questo meccanismo si sono occluse le aperture del piano interrato mediante l'impiego di barre di acciaio resinate atte a solidarizzare l'estradosso del muro controterra con l`intradosso delle travi perimetrali.

La soletta del piano primo, di spessore pari a 11 cm, è realizzata con una lamiera grecata tipo Hi Bond (spessore 0,7 mm) resa collaborante mediante un getto di cls. La lamiera è solidarizzata sia all'orditura principale che a quella secondaria mediante opportuni connettori duttili a taglio; entrambe sono realizzate con travi profilate in acciaio a "doppio T" della serie HEB ed IPE. E stata progettata una connessione a completo ripristino sulle travi principali laddove si è ritenuto che la collaborazione acciaio – cls fosse maggiormente necessaria alla limitazione della deformabilità; nei restanti casi si sono impiegate connessioni a ripristino parziale in modo da garantire un'adeguata resistenza flessionale.

La connessione della struttura metallica alla soletta collaborante permette di sfruttare appieno la capacità resistente del cls, sia in termini di resistenza alla flessione che in termini deformativi oltre che a garantire un'adeguata rigidità nei confronti delle azioni orizzontali.

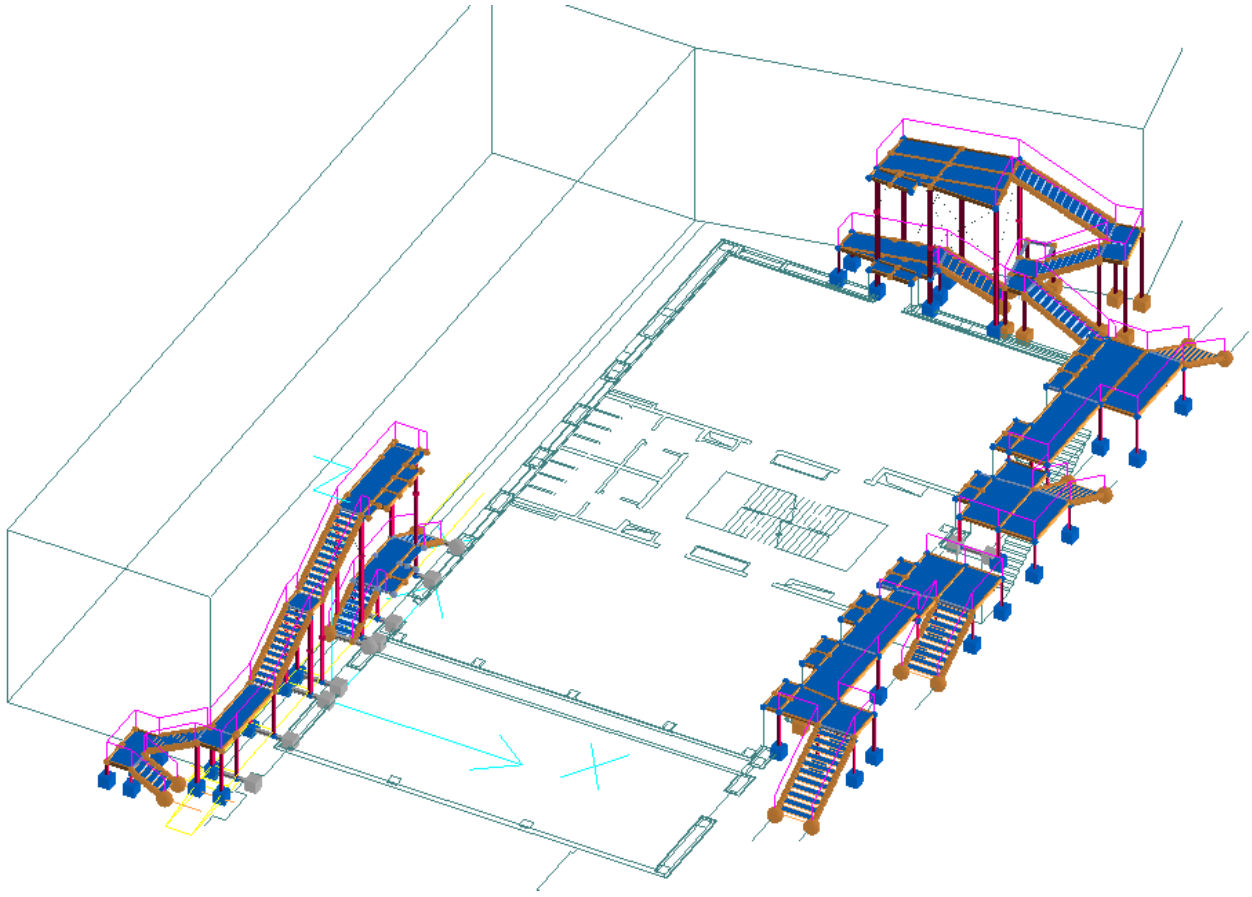
La controventatura di parete delle pilastrate è stata realizzata mediante profilati in acciaio a L disposti a croce di Sant'Andrea laddove non sussistono vincoli di natura architettonica, mentre sulla facciata esposta a sud-est si è reso necessario realizzare controventi di geometria più elaborata per consentire il pieno utilizzo delle uscite di sicurezza e la completa fruibilità dei locali.



Modello di una delle due rampe di scale interne

Le scale interne sono realizzate mediante lame metalliche piegate a comporre due strutture identiche intrecciate tra loro. Queste sono vincolate al piano terreno mediante apposita piastra metallica bullonata all'estradosso del solaio, mentre al piano primo sono agganciate mediante squadrette bullonate e saldature alle travi del solaio perimetrali alla scala stessa. La struttura della scala è formata mediante tre lame sagomate in acciaio (di spessore 15 mm), a cui viene saldata in sommità una lamiera piegata (spessore 10 mm) in modo da generare la sagoma dei gradini. Una coppia di lame d'acciaio trasferisce parte dei carichi alla quota del pianerottolo di arrivo; al contempo una serie di tiranti metallici, svolge la doppia funzione di controvento e di sostegno del pianerottolo, limitando in maniera opportuna le vibrazioni in esercizio. Infine sono stati inseriti, allo scopo di limitare le deformazioni ed irrigidire localmente la struttura, alcune piastre di acciaio di spessore 20 mm.

Le scale esterne sono realizzate con strutture profilari in acciaio. Queste sono concepite completamente indipendenti ai fini statici rispetto alle strutture adiacenti. Le scale prospicenti a sud-est, sono in grado di garantire sia l'evacuazione di emergenza del piano terreno sia l'utilizzo dell'ascensore; sono realizzate con una struttura metallica rivestita in pietra. Le scale restanti sono realizzate con cosciali profilari a C e pedate in acciaio grigliato. La totalità delle scale esterne è fondata su plinti in c.a. che, potrebbero interferire con alcune strutture interrate esistenti, di cui non è nota l'esatta ubicazione. Nei punti d'interferenza i plinti vengono solidarizzati alle strutture esistenti mediante resinatura delle barre d'armatura con apposita resina.



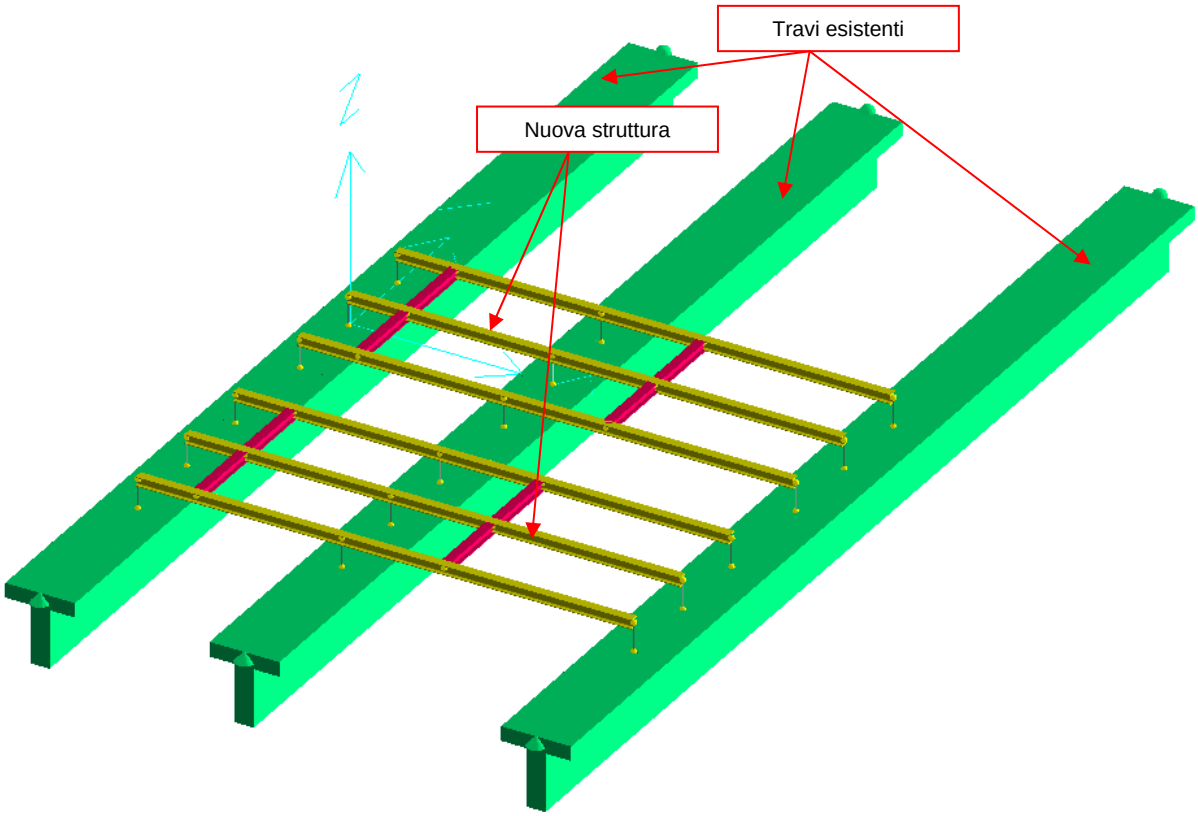
Modello delle scale esterne

Infine, per quanto concerne la disposizione degli impianti di trattamento dell'aria posizionati in copertura, si è reso necessario studiare il consolidamento della struttura esistente per sopperire all'incremento di carico. I macchinari di cui sopra dovranno essere posizionati sopra un idoneo telaio irrigidente in grado di trasmettere le reazioni vincolari in posizioni definite con precisione, secondo gli schemi di calcolo, al di sopra di una sequenza di travi metalliche con profilo HEB 140. Le suddette travi di ripartizione sono state progettate in modo da ripartire il più uniformemente possibile il carico dei macchinari sulle travi di copertura sottostanti (vedasi tav. ES 7.2); si è infatti stabilito di coinvolgere una terna di travi esistenti per sopperire all'incremento di carico.

Le travi di copertura sono state analizzate, con lo scopo di verificarne l'idoneità statica, sulla base delle dimensioni effettive rilevate. Le armature di acciaio sono state computate come previsto dalle tavole di carpenteria originali. Per quanto riguarda le caratteristiche dei materiali costituenti le travi, trovandoci in assenza di prelievi e d'indicazioni più precise, sono state effettuate le seguenti ipotesi:

- calcestruzzo C20/25 (R_{ck} = 25 MPa);
- acciaio FeB32k (f_{yk} = 315 MPa e σ_{amm} = 160 MPa).

Le travi di copertura sono state considerate cautelativamente in condizioni di semplice appoggio trascurando l'eventuale continuità strutturale con le travi di banchina.



Modello del supporto per UTA in copertura

Le travi di copertura, analizzate con il metodo delle tensioni ammissibili, non sono idonee a sopperire ai carichi delle UTA. Si è reso quindi necessario provvedere al loro consolidamento con la tecnica del béton plaqué, che nello specifico consiste nel rendere solidale alla superficie della trave delle lame metalliche. L'adesione è garantita tramite l'applicazione di una resina epossidica bicomponente ad alto potere adesivo alla superficie del calcestruzzo, previo opportuno trattatamento mediante sabbiatura. L'opportuna disposizione di queste piastre permette di incrementare sia la resistenza flessionale sia la resistenza alle azioni tangenziali.

4. ANALISI DEI CARICHI

Le combinazioni dei carichi sono conformi con quanto prescritto nell'Eurocodice 1 (UNI EN 1990/2004) e nel Nuove Norme Tecniche per le Costruzioni" di cui al D.M. 14/01/2008

Generalità sul metodo dei coefficienti parziali

Quando si impiega il metodo dei coefficienti parziali, si deve verificare che, in tutte le situazioni di progetto significative, non venga superato nessuno stato limite significativo quando si impiegano nei modelli di progetto valori di progetto delle azioni o degli effetti delle azioni e delle resistenze.

Per le situazioni di progetto selezionate e per gli stati limite significativi, le singole azioni per i casi di carico critici dovrebbero essere combinati come indicato in dettaglio in seguito. Tuttavia, le azioni che non possono verificarsi simultaneamente, per esempio per ragioni fisiche, non dovrebbero essere considerate combinate tra loro.

4.1 Combinazione delle azioni

Ai fini delle verifiche degli stati limite si definiscono le seguenti combinazioni delle azioni:

- COMBINAZIONE FONDAMENTALE (impiegata per gli SLU)

$$\left\{\sum_{j\geq 1}\gamma_{G,j}G_{k,j} + \gamma_P P + \gamma_{Q,1}\cdot Q_{K,1} + \sum_{i\geq 1}\gamma_{Q,i}\psi_{0,i}\cdot Q_{k,i}\right\} \text{ con } \begin{cases} j \geq 1 \\ i > 1 \end{cases}$$

- COMBINAZIONE CARATTERISTICA (Rara) (impiegata per gli SLE Irreversibili)

$$\left\{\sum_{j\geq 1} G_{k,j} + P + \sum_{i\geq 1} \psi_{0,i} \cdot Q_{k,i}\right\} \text{con} \begin{cases} j \geq 1 \\ i > 1 \end{cases}$$

- COMBINAZIONE FREQUENTE (impiegata per gli SLE reversibili)

$$\left\{\sum_{j\geq 1} G_{k,j} + P + \sum_{i\geq 1} \psi_{1,i} \cdot Q_{k,i}\right\} \text{con} \begin{cases} j \geq 1 \\ i > 1 \end{cases}$$

- COMBINAZIONE QUASI PERMANENTE (impiegata per gli effetti a lungo termine)

$$\left\{\sum_{j\geq 1} G_{k,j} + P + \sum_{i\geq 1} \psi_{2,i} \cdot Q_{k,i}\right\} \text{con} \begin{cases} j \geq 1 \\ i > 1 \end{cases}$$

- COMBINAZIONE SISMICA

$$\left\{\sum_{j\geq 1} G_{k,j} + P + E + \sum_{i\geq 1} \psi_{2,i} \cdot Q_{k,i}\right\} \text{con} \begin{cases} j \geq 1 \\ i > 1 \end{cases}$$

5. ANALISI DEL TELAIO.

5.1 Criteri di analisi della sicurezza

Con riferimento alle normative precedentemente citate, le strutture in oggetto sono verificate per quanto riguarda:

- verifica di resistenza;
- verifica di deformazione;

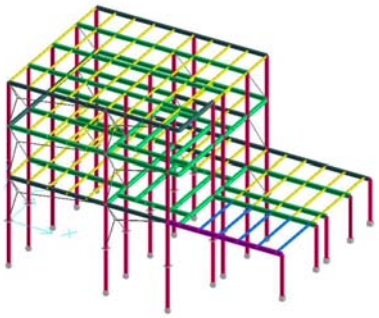
5.2 Schematizzazione della struttura e dei vincoli

La struttura è stata schematizzata escludendo il contributo degli elementi aventi rigidezza e resistenza trascurabili a fronte dei principali. E' quindi stata considerata l'orditura a telaio tridimensionale.

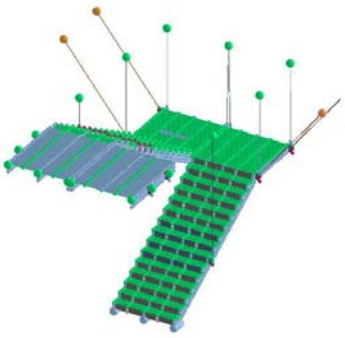
In particolare è stato trascurato il contributo di rigidezza nei confronti di forze orizzontali di tutti gli elementi strutturali metallici.

Riportiamo nel seguito i quattro modelli esaminati per progettare e verificare le sezioni dell'ossatura portante:

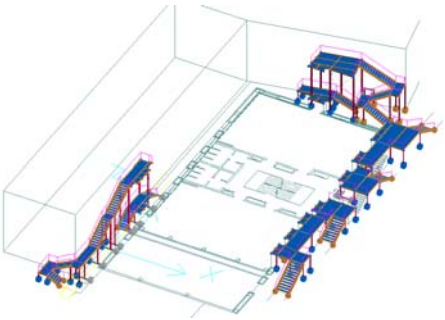
BLOCCO 1 => STRUTTURA METALLICA (modello 11213A):



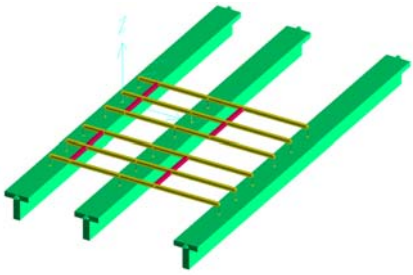
BLOCCO 2 => SCALA INTERNA – lato A (modello 11213B):



BLOCCO 3 => SCALE ESTERNE (modello 11213T):



BLOCCO 4 => RINFORZO COPERTURA (modello 11213S)



5.3 Modellazione dei materiali

Ai fini dell'analisi strutturale è stata utilizzata un'analisi lineare elastica in cui si è cercato di tenere in conto, per quanto possibile, i fenomeni non-lineari, quali la viscosità e la fessurazione, gli effetti della temperatura e le fasi costruttive. Per costruzioni poco sensibili ai fenomeni del secondo ordine e quindi non suscettibili ai problemi di stabilità locale è possibile tenere in conto la viscosità delle travi sostituendo l'area della porzione in calcestruzzo con aree equivalenti ridotte in ragione del coefficiente di omogenizzazione. Secondo le NTC, di cui al paragrafo 4.3.2.2.1, "Salvo più precise valutazioni, il modulo di elasticità del calcestruzzo per effetti a lungo termine può essere considerato pari al 50% del suo valore medio istantaneo, E_{cm}". Il momento resistente, per sezioni di classe 1 o 2, si valuta ipotizzando la conservazione delle sezioni piane, assumendo una configurazione delle tensioni equilibrata. L'armatura longitudinale in soletta si assume plasticizzata così come la sezione in acciaio. Sotto l'effetto di sollecitazione flettente con segno positivo, la sezione efficace del calcestruzzo ha una tensione di compressione pari a $0{,}85f_{cd}$, fornendo una risultante di compressione che tiene conto del grado di connessione a taglio. La resistenza del calcestruzzo a trazione è trascurata.
Per il calcolo delle deformazioni, l'inerzia della sezione mista è calcolata considerando il modulo di elasticità del calcestruzzo a lungo termine e quindi un coefficiente di omogenizzazione, cautelativamente assunto pari a 15.

5.4 Modellazione della struttura e dei vincoli

La struttura è modellata con il metodo degli elementi finiti, applicato a sistemi tridimensionali. Gli elementi utilizzati sono sia monodimensionali (trave con eventuali sconnessioni interne), che bidimensionali (piastre e membrane triangolari e quadrangolari). I vincoli sono considerati puntuali ed inseriti tramite le sei costanti di rigidezza elastica.

I solai, vista l'esistenza della connessione tra acciaio e cls, possono essere considerati come piani infinitamente rigidi.

5.5 Schematizzazione delle azioni

In accordo con le sopracitate normative, sono state considerate nei calcoli le seguenti azioni:

- pesi propri strutturali;
- carichi permanenti portati dalla struttura;
- carichi accidentali sulla struttura
- azione sismica;

Le condizioni ed i casi di carico prese in conto nei calcolo sono specificate nella stampa dei dati di input.

Le azioni sono state modellate tramite opportuni carichi concentrati e distribuiti su nodi ed aste.

5.6 Tipo di analisi

Le analisi strutturali condotte sono di tipo statico lineare. Il metodo di calcolo è ad elementi finiti. La verifica delle membrature in acciaio viene eseguita considerando tutte le caratteristiche di sollecitazione.

5.7. Individuazione del codice di calcolo

Per il calcolo delle sollecitazioni e per la verifica di travi e pilastri in cemento armato si è fatto ricorso all'elaboratore elettronico utilizzando il seguente programma di calcolo:
DOLMEN WIN (R), versione 10 del 2010 prodotto, distribuito ed assistito dalla CDM DOLMEN srl, con sede in Torino, Via Drovetti 9/F.

Questa procedura è sviluppata in ambiente Windows, ed è stata scritta utilizzando i linguaggi Fortran e C. DOLMEN WIN permette l'analisi elastica lineare di strutture tridimensionali con nodi a sei gradi di libertà utilizzando un solutore ad elementi finiti. Gli elementi considerati sono la trave, con eventuali svincoli interni o rotazione attorno al proprio asse, ed il guscio, sia rettangolare che triangolare, avente comportamento di membrana e di piastra. I carichi possono essere applicati sia ai nodi, come forze o coppie concentrate, sia sulle travi, comme forze distribuite, trapezie, concentrate, come coppie e come distorsioni termiche. I vincoli sono forniti tramite le sei costanti di rigidezza elastica.

A supporto del programma è fornito un ampio manuale d'uso contenente fra l'altro una vasta serie di test di validazione sia su esempi classici di Scienza delle Costruzioni, sia su strutture particolarmente impegnative e reperibili nella bibliografia specializzata.

5.8 Grado di affidabilità del codice

L'affidabilità del codice di calcolo è garantita dall'esistenza di un ampia documentazioe di supporto, come indicato nel paragrafo precedente. La presenza di un modulo CAD per l'introduzione di dati permette la visualizzazione dettagliata degli elementi introdotti. È possibile inoltre ottenere rappresentazioni grafiche di deformate e sollecitazioni della struttura. Al termine dell'elaborazione viene inoltre valutata la qualita' della soluzione, in base all'uguaglianza del lavoro esterno e dell'energia di deformazione.

5.9 Motivazione della scelta del codice

DOLMEN WIN permette in campo elastico lineare un'analisi dettagliata del comportamento dell'intera struttura. È possibile inoltre scegliere il grado di affinamento dell'analisi di elementi complessi utilizzando mesh via via più dettagliate.

Il modello, realizzato con il programma di calcolo Dolmenwin rel.10 della CDM di Torino, tiene conto delle reali dimensioni e rigidezze degli elementi strutturali nonché gli effettivi vincoli e carichi agenti.

Nel calcolo sono stati introdotti i seguenti carichi: pesi propri, carichi permanenti, carichi variabili, sisma x e sisma y, peso dei tamponamenti.

6. ANALISI SISMICA.

La struttura in oggetto è caratterizzata sostanzialmente da 3 blocchi fuori terra (struttura metallica, scale interne e scale esterne) con comportamento sismico differente.
Vista la connessione tra la scala interna e l'impalcato del primo piano, al fine di riuscire a considerare le azioni reciprocamente scambiate si è proceduto nel seguente modo:

- È stata fatta l'analisi dinamica della scala interna considerata vincolata mediante cerniere sferiche all'ossatura portante circostante.
- Ricavato il periodo proprio di vibrazione della struttura è stato ricavata l'accelerazione relativa.
- È stata effettuata un'analisi statica equivalente sulla scala interna con l'accelerazione sopracitata.
- Sono state riportate sul modello della struttura metallica (11213A) le reazioni delle cerniere sferiche che vincolavano il modello della scala.
- Le azioni sono state riproposte in maniera simmetrica sul modello della struttura metallica per tener conto della scala non modellata.

6.1 Definizione della vita nominale dell'edificio

Con riferiemento ai tipi di costruzione indicati nel prospetto 2.4.1 – NTC, l'edificio in oggetto di analisi NON è definibile come opera di importanza strategica, pertanto si assume

$V_n \geq 50$ anni

6.2 Identificazione della classe d'uso dell'edificio

Con riferimento alle conseguenze di una interruzione di operatività o di un eventuale collasso, in presenza di azioni sismiche le NTC suddividono gli edifici in 4 classi d'uso nel seguito brevemente definite:

Classe I: Costruzioni con presenza occasionale di persone, edifici agricoli;
Classe II: Costruzioni il cui uso preveda normali affollamenti, senza contenuti pericolosi per l'ambiente e senza funzioni pubbliche e sociali essenziali;
Classe III: Costruzioni il cui uso preveda affollamenti significativi. Industrie con attività pericolose per l'ambiente;
Classe IV: Costruzioni con funzioni pubbliche o strategiche importanti, anche con riferimento alla gestione e protezione civile in caso di calamità.

In accordo a tali definizioni, l'edificio in analisi può essere definito come appartente alla **classe d'uso II.**

6.3 Calcolo del periodo di riferimento per l'azione sismica.

Il periodo di riferimento vale:

$$V_R = V_n \cdot C_U$$

Dove C_U è il coefficiente d'uso definito nel prospetto 2.4.II. Per edifici in classe d'uso IV si ha C_U=1

Pertanto

V_R = 50 anni

6.4 Ubicazione dell'edificio.

L'edificio è sito nel comune di Torino (TO). Nota l'ubicazione del sito, dall'allegato alle NTC si ottengono i parametri spettrali seguenti:

Valori risultanti :

a_g 0.566 [g/10]

F_o 2.758

T_C^* 0.270

Dove: a_g= accelerazione massima del sito

F_0= valore massimo di amplificazione dello spettro in accelerazione orizzontale;

T_{C^*}= periodo di inizio del tratto a velocità costante dello spettro in accelerazione orizzontale.

6.5 Identificazione del tipo di terreno

In base alle risultanze geotecniche delle indagini effettuate nell'anno 2004 per la realizzazione degli edifici adiacenti, facenti parte dell'ampliamento del Politecnico di Torino, il terreno su cui insiste l'edificio è assimilabile ai terreni tipo B, secondo la definizione riportata nel prospetto 3.2.2 – NTC

Le condizioni topografiche sono di terreno pianeggiante percui ricadente nella categoria T1 della tabella 3.2.IV - NTC

6.6 Individuazione dello spettro elastico per azione orizzontale.

Lo spettro elastico è descritto dalle espressioni riportate al punto 3.2.3.2.1 – NTC

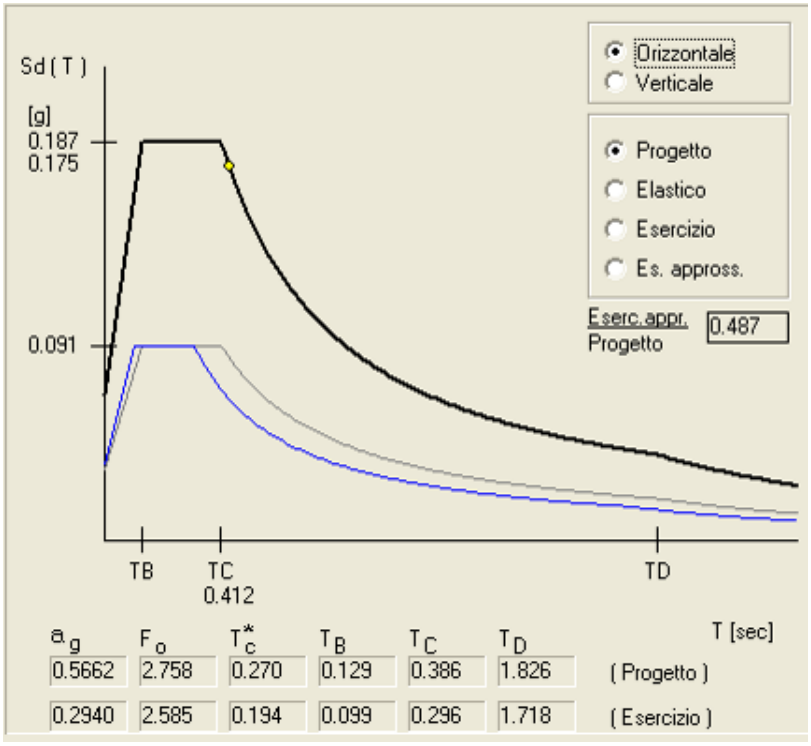
In base a quanto sopra esposto si ricavano i seguenti valori dei parametri sisimici:

$C_c = 1.05 \cdot (T_c^*)^{-0.33}$ rif. Tabella 3.2.V – NTC

$S_s = 1.00 \le 1.70 - 0.60 \cdot F_0 \cdot \frac{a_g}{g} \le 1.5$ rif. Tabella 3.2.V – NTC

S_t= 1.00 rif. Tabella 3.2.VI – NTC

h=1 per uno smorzamento viscoso pari al 5%



6.7 Scelta della classe di duttilità.

Si decide di realizzare l'edificio in CD"B" (classe di duttilità bassa)

6.8 Calcolo del fattore di struttura

Il coefficiente di struttura q può essere calcolato mediante la seguente espressione (7.3.1 – NTC):

$q = q_0 \cdot K_R$

Dove:

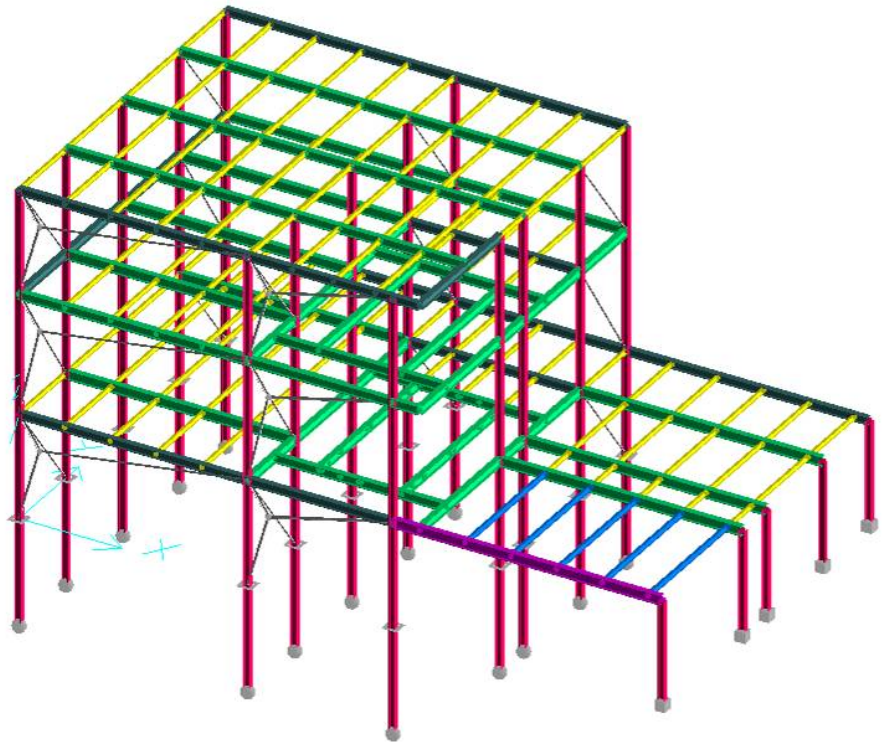
q_0 è il valore massimo del coefficiente di struttura che dipende dal livello di duttilià attesa, dalla tipologia strutturale e dal rapporto $\frac{\alpha_u}{\alpha_1}$ tra il valore dell'azione sismica per il quale si verifica la formazione di un numero di cerniere plastiche tali da rendere la struttura labile e quello per il quale il primo elemento strutturale raggiunge la plasticizzazione a flessione.

K_R è un fattore riduttivio per strutture non regolari in altezza ed è pari a 0.8

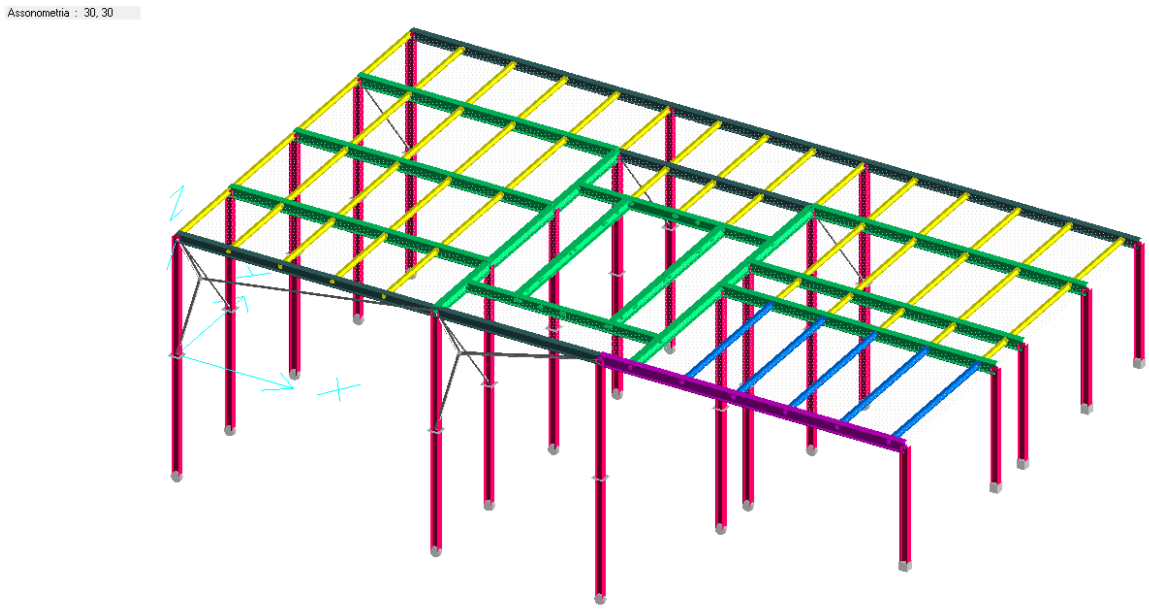
In base a quanto esposto nel paragrafo C7.4.5 della circolare applicativa, si evince che la struttura in oggetto ricade nelle strutture a telaio (fig. C7.4.2 – circolare applicativa).

A favore di sicurezza e al fine di non dover garantire la gerarchia delle resistenze, si è scelto di non usufruire delle risorse di duttilità strutturale sotto sisma. Per questo motivo il fattore di struttura q è stato preso pari al suo valore minimo ovvero 1,0.

7. MODELLO 11213A (struttura metallica)



Modello analizzato



Struttura realizzata

Il modello analizzato è già comprensivo della struttura ampliata. L'analisi sismica, i carichi sui pilastri e la posizione dei controventi sono dunque riferiti alla struttura comprensiva di ampliamento. Il piano interrato si comporta sismicamente come uno scatolare, ragion per cui la sollecitazione

sismica è computata a partire dall'estradosso del solaio del piano terra, che impedisce le traslazioni sul piano orizzontale dei pilastri.

La modellazione non considera il comportamento misto degli impalcati ma considera semplicemente la struttura in acciaio. La collaborazione acciaio – cls è stata invece considerata in fase di dimensionamento e di verifica degli elementi, facenti parte dell'impalcato del piano primo: questo ha permesso, senza modificare lo spessore di solaio, di ridurre le sollecitazioni dei profilati e contenere la deformabilità in esercizio. In questo modo è stato possibile disporre profilati meno alti e ridurre quindi le quantità di acciaio di carpenteria. Le larghezze collaboranti degli elementi sono state limitate cautelativamente ad un massimo di 1,50 m le travi che supportano il solaio dalle due estremità ed a 0,90 m per le travi di bordo. Questi valori in taluni casi sono ampliamente inferiori a quanto previsto dalle NTC.

Le carpenterie del piano secondo e della copertura (riferite all'eventuale futuro ampliamento) non sono soggette a dimensionamento.

PRESA IN CONTO DEI MOMENTI TORCENTI DI PIANO DOVUTI AL SISMA

Per la presa in conto dei momenti torcenti di piano è stata eseguita un'analisi statica equivalente in quanto il fabbricato rispetta i requisiti richiesti riportati nel paragrafo 7.3.3.2 del D.M. 14 Gennaio 2008.

L'accelerazione presa in conto è Sd = 0.031 g ovvero quella corrispondente al valore del periodo proprio T_1 = 2.078 s dello spettro di progetto ottenuto con q=1,0.

Nel foglio di calcolo presentato nella pagina precedente sono state eseguite le verifiche flessionali nei confronti delle sollecitazioni massime di SLU ricavate dal modello e le verifiche deformative allo SLE in cambinazione caratteristica, limitando la deformazione massima degli elementi a 1/250 della luce come previsto dalle NTC. Per gli elementi di supporto ai tiranti della scala è stata limitata la deformabilità ad almeno 1/500 della luce in modo da influenzare il meno possibile il comportamento dei tiranti in acciaio.

Nel foglio di calcolo sopra citato è stato considerato il comportamento misto acciaio - cls delle sezioni con un coefficiente di omogenizzazione pari a 15.

La resistenza al taglio delle sezioni è data dalla sola carpenteria metallica, come previsto dalle NTC. Si riportano in seguito le verifiche effettuate con Dolmen, nelle quali sono stati considerati gli sforzi di taglio e normali:
